Treatment with UrgoStart Plus

On commencing **UrgoStart Plus Pad** the patient experienced **increased exudate for two weeks**, which is an **expected outcome** of the dressing **during the cleaning phase** and was managed with absorbent pads and more nursing visits.

The patient also reported a **reduction in pain** and was delighted to achieve wound healing progress **after six years**.

Final result: The cleaning abilities of the dressing's poly-absorbent fibres were observed, and the wound progressed to **100% granulation tissue within 12 weeks**. Significant wound area reduction was seen, and **complete healing was achieved within 18 weeks**.
